Introducing a Floor Safety Management Program

Safe Space Ingenuity, Inc. is in the business of preventing slips, trips and falls. SSI is a floor safety consulting firm which offers a wide range of floor safety management services.

SSI provides in-field Coefficient of Friction (COF) testing on all hard surfaced flooring.

COF testing is the measurement of slip resistance potential on hard surfaced flooring.

SSI auditors follow strict protocols and procedures as outlined in industry standards, to insure high levels of slip resistance potential on hard surfaced flooring.

An estimated 5 million Americans have experienced some form of TBI disability. Let the certified auditors at SSI reduce these staggering statistics by helping to prevent slip, trip and fall accidents.

Slip & Falls Can Lead to Traumatic Brain Injury

A traumatic brain injury (TBI) occurs every 15 seconds. A TBI can occur any time the brain is forced against the inside of your skull due to an accident or injury. A hard blow to the head may cause a movement of the brain inside the skull which will result in a TBI. TBI is a very complex injury with a broad spectrum of symptoms and resulting disabilities. Slip and fall accidents are the second leading cause of TBI.

Slip and fall injuries for most of us are nothing more than a simple embarrassment, however a simple slip and fall could lead to a serious brain injury. The greatest risk of falling, in fact, is that you will hit your head on the way down. More than eight million people are injured from slip and fall accidents each year, and thousands die from these accidents. Statistics report that approximately 35% of brain injuries are caused by falls. Prevention of TBI is the best approach since there is no cure!
